SEE OFFICE ACTION ON THE FOLLOWING PAGES	

The disclosure is objected to because of the following informalities: In the continuing data paragraph "continuation" should be --divisional--, the status of the parent application should be updated, and the reference to the specification of the current application should simply be deleted. Appropriate correction is required.

Claims 1 - 10, 12 - 22, and 29 are rejected under 35 U.S.C. § 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

In claim 1 lines 2 - 5 the application of the liquid toner particles should be a method step within the claim. In line 6 "for" should presumably be --by--. In lines 8 - 9 it is not clear how the removing of the non-fixed toner particles changes the ink acceptance behavior of the layer. Since the toner is removed the layer is no longer present in these areas.

Claims 1 - 10, 12 - 22, and 29 are rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

In claim 1 it is not clear from the specification how the breaking down of the non-fixed toner particles changes the ink acceptance behavior. There is no disclosure of the type of materials that would provide this result.

In claim 29 it is not clear how fixing the toner in the non-image locations and removing the toner from the image locations results in a functional printing plate. It is not apparent from the disclosure which of the toner or the printing form carries the ink and dampening fluid or

what specific materials of the toner and the printing form would provide this. See the first full paragraphs on pages 10 and 12 in the specification.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1 - 10, 12 - 14, 19, 20, 22, and 29 are rejected under 35 U.S.C. 103(a) as being unpatentable over Doyle (EP 099,264) in view Raschke et al. (US 3,921,527) and Calabrese et al. (US 4,705,696).

Doyle teaches the method as recited with exception of charging the printing form, applying "liquid" toner particles, and erasing the fixed toner particles after a printing process.

Note that Doyle teaches on page 4 to electrostatically charge the toner to retain it on the form.

Raschke et al. teach the conventionality of charging the entire printing form, applying toner to the entire surface of the printing form, and erasing the fixed toner particles after a printing process. See the Abstract, column 3 lines 56 - 68, and column 5 lines 1 - 9 and 39 - 44 of Raschke et al.

Calabrese et al. teach the conventionality of applying and fixing liquid toner particles to a printing form. See the entire document of Calabrese et al.

It would have been obvious to one of ordinary skill in the art to provide the method of Doyle with the step of charging the printing form and erasing the fixed toner in view of Raschke et al. as an alternative to charging the toner and to reuse the printing form and provide liquid toner particles in view of Calabrese et al. teaching the conventionality of such. With respect to claim 22 it would have been obvious to one of ordinary skill in the art to supplement the solvent erasing step of Raschke et al. with a brush or cloth to facilitate removal of the fixed toner particles. With respect to claim 29 it would have been obvious to one of ordinary skill in the art to reverse the printing characteristics of the form and the toner.

Claim 15 is rejected under 35 U.S.C. 103(a) as being unpatentable over Doyle in view of Raschke et al. and Calabrese et al. as applied to the claims above, and further in view of Back (US 3,607,255). Back teaches the conventionality of hydrophilizing the regions not covered by the toner. See the Abstract of Back, for example. It would have been obvious to one of ordinary skill in the art to provide the method of Doyle, as modified by Raschke et al. and Calabrese et al., with the step of hydrophilizing the regions not covered by toner in view of Back so as to provide an adequately hydrophilic surface on the printing plate.

Claims 16 and 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Doyle in view of Raschke et al. and Calabrese et al. as applied to the claims above, and further in view of Chu et al. (US 4,103,616). Chu et al. teaches the conventionality of crosslinking toner particles with UV radiation. See column 3 lines 2 - 23 of Chu et al. It is noted that lamps, including mercury, are conventional sources of UV radiation. It would have been obvious to one of ordinary skill in the art to provide the method of Doyle, as modified by Raschke et al. and Calabrese et al., with the step of crosslinking the toner particles with UV radiation in view of Chu et al. as an alternative to melting the toner particles with infrared radiation.

Claim 18 is rejected under 35 U.S.C. 103(a) as being unpatentable over Doyle in view of Raschke et al. and Calabrese et al. as applied to the claims above, and further in view of Peterson (US 4,020,762). Peterson teaches the conventionality of using a light source to ablate a carbon material from a printing plate. Carbon is a conventional material in toners. See column 1 lines 35 - 50 of Peterson. It would have been obvious to one of ordinary skill in the art to provide the method of Doyle, as modified by Raschke et al. and Calabrese et al., with the step of ablating the toner in view of Peterson as an alternative toner removing step.

Claim 21 is rejected under 35 U.S.C. 103(a) as being unpatentable over Doyle in view of Raschke et al. and Calabrese et al. as applied to the claims above, and further in view of Tomanek (US 3,650,797). Tomanek teaches the conventionality of removing toner from a printing plate with an alkaline solution. See the Abstract of Tomanek, for example. It would have been obvious to one of ordinary skill in the art to provide the method of Doyle, as modified by Raschke et al. and Calabrese et al., with the step of removing the fixed toner with an alkaline solution in view of Tomanek as a well known alternative solvent.

Applicant's arguments with respect to claim 1 have been considered but are moot in view of the new ground(s) of rejection. With respect to the 35 U.S.C. § 112, first paragraph, rejections applicant has not provided any specific examples to support the contention that the materials would have been obvious to one of ordinary skill in the art.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Stephen Funk whose telephone number is (703) 308-0982. The examiner can normally be reached on Monday - Thursday from 7:30 am to 6:00 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Edgar Burr, can be reached at (703) 308-0979. The fax number for incoming official papers is (703) 308-7722, 7724. The fax number for informal papers in Art Unit 2854 is (703) 308-2864.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 305-4900.
